AI-Powered Cybersecurity Threat Detection

🅰️ PROJECT EXPLANATION

🔹 What is AI-Powered Cybersecurity Threat Detection?

👉 Simple Explanation

It is a system that uses **Artificial Intelligence (AI)** to automatically detect suspicious activities in computer networks.

Instead of humans checking logs manually, AI:

- analyzes patterns
- detects unusual behavior
- alerts when something looks like a cyber attack

👉 Technical Explanation

AI-based cybersecurity systems use:

- **Machine Learning models**
- **Statistical anomaly detection**
- **Behavioral analysis**

to classify:

- Normal traffic vs Malicious traffic

🔹 Problems It Solves

- Manual monitoring is slow ❌
- Huge data (millions of logs) ❌

- Unknown attacks (zero-day attacks) ❌

👉 AI solves:

- Real-time detection ✅
- Pattern recognition ✅
- Early warning alerts ✅

🔹 Why Important Today?

- Cyber attacks are increasing daily
- Systems are becoming complex
- Data breaches cost millions

👉 AI enables:

- automated SOC (Security Operations Center)
- scalable defense systems

🔹 Industry Use Cases

🏦 Banks

- Fraud detection (credit card misuse)
- Suspicious login detection

💻 IT Companies

- Intrusion Detection Systems (IDS)
- Log monitoring

📦 Product Companies

- Malware detection
- User behavior analytics

🔹 Real Applications

Use Case	Example
Intrusion Detection	Detect unauthorized access

Fraud Detection	Unusual transaction pattern
Anomaly Detection	Sudden traffic spike
Malware Detection	Suspicious file behavior
Network Monitoring	Packet-level analysis

🔹 Complete Workflow

Data Collection → Preprocessing → Feature Engineering → Model Training → Prediction → Alert Generation → Visualization

Step-by-step:

1. Collect dataset (network traffic)
2. Clean data
3. Select features
4. Train ML model
5. Predict attack vs normal
6. Generate alerts
7. Visualize results

🅱️ TECH STACK OPTIONS

✅ Option A (BEST for YOU – Beginner + Strong GitHub)

- Python
- Pandas, NumPy
- Scikit-learn
- Matplotlib, Seaborn
- Model: Random Forest / Isolation Forest
- Dataset: KDD Cup / CICIDS

✔ Difficulty: Easy
✔ GPU: ❌ Not required
✔ Output: Attack detection + graphs

⚙️ Option B (Intermediate)

- Python + Scikit-learn
- Flask (web app)
- Dataset: UNSW-NB15
- Model: XGBoost

✔ Difficulty: Medium
✔ Output: Web dashboard

🚀 Option C (Advanced)

- Deep Learning (TensorFlow / PyTorch)
- LSTM / Autoencoders
- Real-time streaming (Kafka)

✔ Difficulty: Hard
✔ GPU: Optional

🅒 SELECTED APPROACH

👉 **Option A (BEST choice)**

Reason:

- Easy to implement
- Strong for GitHub
- Industry-relevant
- Fast execution

🅓 ARCHITECTURE

🔹 Block Diagram

[Dataset]

[Prediction Engine]
↓
[Alert System]
↓
[Visualization Dashboard]

🔹 Modules

1. Input Data

- Network logs dataset (KDD Cup)

2. Preprocessing

- Handle missing values
- Encode categorical data

3. Feature Engineering

- Select important features

4. Model

- Random Forest / Isolation Forest

5. Prediction

- Classify: Normal / Attack

6. Alert Generation

- Print/log suspicious events

7. Visualization

- Graphs, confusion matrix

🅕 INSTALLATION

🔹 Python Version

Python 3.9+

🔹 Create Virtual Environment

Windows:

```
python -m venv venv
venv\Scripts\activate
```

Mac/Linux:

```
python3 -m venv venv
source venv/bin/activate
```

🔹 Install Libraries

pip install pandas numpy scikit-learn matplotlib seaborn

🔹 requirements.txt

```
pandas
numpy
scikit-learn
matplotlib
seaborn
```

🅖 COMPLETE CODE

🔹 main.py

```
from src.data_preprocessing import load_data, preprocess_data
from src.feature_engineering import feature_selection
from src.model import train_model, predict
from src.evaluate import evaluate_model
from src.visualize import plot_confusion

# Step 1: Load Data
data = load_data("data/kdd.csv")

# Step 2: Preprocess
X, y = preprocess_data(data)

# Step 3: Feature Selection
X = feature_selection(X)

# Step 4: Train Model
model, X_test, y_test = train_model(X, y)

# Step 5: Prediction
y_pred = predict(model, X_test)

# Step 6: Evaluation
evaluate_model(y_test, y_pred)

# Step 7: Visualization
plot_confusion(y_test, y_pred)
```

🔹 src/data_preprocessing.py

```
import pandas as pd
from sklearn.preprocessing import LabelEncoder

def load_data(path):
    return pd.read_csv(path)

def preprocess_data(df):
    df = df.dropna()

    le = LabelEncoder()
    for col in df.select_dtypes(include=['object']).columns:
        df[col] = le.fit_transform(df[col])

    X = df.drop('label', axis=1)
    y = df['label']

    return X, y
```

🔹 src/model.py

```
from sklearn.ensemble import RandomForestClassifier
from sklearn.model_selection import train_test_split

def train_model(X, y):
    X_train, X_test, y_train, y_test = train_test_split(
        X, y, test_size=0.2
    )

    model = RandomForestClassifier()
    model.fit(X_train, y_train)

    return model, X_test, y_test

def predict(model, X):
    return model.predict(X)
```

🔹 src/evaluate.py

```
from sklearn.metrics import accuracy_score, precision_score, recall_score, f1_score

def evaluate_model(y_test, y_pred):
    print("Accuracy:", accuracy_score(y_test, y_pred))
    print("Precision:", precision_score(y_test, y_pred, average='weighted'))
    print("Recall:", recall_score(y_test, y_pred, average='weighted'))
    print("F1 Score:", f1_score(y_test, y_pred, average='weighted'))
```

🔹 src/visualize.py

```
import seaborn as sns
import matplotlib.pyplot as plt
from sklearn.metrics import confusion_matrix

def plot_confusion(y_test, y_pred):
    cm = confusion_matrix(y_test, y_pred)
    sns.heatmap(cm, annot=True, fmt='d')
    plt.title("Confusion Matrix")
    plt.savefig("images/confusion_matrix.png")
    plt.show()
```

🅷 SIMULATION OF CYBER THREATS

🔹 How Dataset Simulates Real World

- Each row = network connection
- Features = protocol, duration, bytes
- Label = normal / attack

🔹 Attack Types

- DoS → high traffic
- Probe → scanning
- R2L → unauthorized login

🔹 Simulation Steps

Step 1

Load dataset

Step 2

Train model

Step 3

Run prediction

Step 4

Identify anomalies

Step 5

Generate alerts

🔹 Example Alert

⚠️ ALERT: Suspicious activity detected at index 105

🅸 HOW TO RUN

python main.py

Expected Output

Accuracy: 0.95
Precision: 0.94
Recall: 0.93
F1 Score: 0.93

🅹 GITHUB UPLOAD

Commands

```
git init
git add .
git commit -m "Initial commit - AI Threat Detection"
git branch -M main
git remote add origin <repo-url>
git push -u origin main
```

L COMMIT PLAN

Day	Task	Commit Message
Day 1	Setup	"Project setup complete"
Day 2	Dataset	"Added dataset"
Day 3	Preprocessing	"Data cleaning module"
Day 4	Model	"Implemented Random Forest"
Day 5	Evaluation	"Added evaluation metrics"
Day 6	Visualization	"Added confusion matrix"

Day 7	Final	"Final project upload"

🅼 PROOF CHECKLIST
